Vickers®

Piston Pumps

Vickers Pump PVQ
Variable Displacement, Quiet Series
For Industrial Applications
PVQ piston pumps are in-line, variable displacement units and are available in nine sizes. Displacement is varied by means of pressure and/or flow compensator controls. An impressive assortment of control options offers maximum operating flexibility.

PVQs operate at quietness levels that meet today’s demanding industrial conditions. The sound level of each unit approaches or is below that of the electric motor driving it. Sound is reduced by a patented timing arrangement that also produces low pressure “pulses” in the outlet flow. This leads to reduced tendencies for noise in systems using PVQs.

The PVQ series is capable of operating with many types of hydraulic fluid. Water-content and phosphate ester fluids can be accommodated, in addition to the typical petroleum based and synthetic fluids.

Many PVQ pumps are available in a thru-drive configuration to accommodate a multitude of application and installation requirements. Thru-drive models can be coupled to various types and sizes of fixed and variable displacement pumps, resulting in a compact and versatile package. Such a package offers lower installed cost by reducing the installation size and by requiring only one mounting pad on the prime mover.

Quiet PVQs have excellent operating characteristics, and the pumps’ many control and mounting options allow choosing the optimum model for any application. Additionally, PVQs possess the same durability and long life characteristics expected of the best industrial products in today’s marketplace. For over 75 years, the Vickers name has been synonymous with long trouble-free service.

- **S3** – British Standard Parallel Threads
- **S9** – Special CG compensator for use with electronically modulated relief valves
**Controls**

**Pressure Compensators**

**“C” & “CM”**

The pressure compensator control automatically adjusts pump delivery to maintain volume requirements of the system at a preselected operating pressure. Maximum pump delivery is maintained to approximately 3.4 bar (50 psi) below the pressure setting before being reduced. The pressure compensator control operates on one side of center and has an adjustment range as designated in the model coding.

**“C” & “CM”**

**Pressure Compensator with Adjustable Maximum Displacement Stop “D”**

The adjustable maximum stop pressure control enables the maximum pump delivery to be externally adjusted from 25% to 100% while maintaining all of the standard features of a pressure compensated pump. To assist initial priming, manual adjustment control setting must be at least 40% of maximum flow position.

**Remote Control Pressure Compensator “CG”**

Exactly the same as the “C” (pressure compensation option) except the machine operator is able to change the compensator setting through the use of a remote pilot relief valve, such as Vickers C-175.

**Electric Dual Range Pressure Compensator “CD”**

The dual range pressure compensator control automatically adjusts pump delivery to maintain volume requirements of the system at either of two preselected operating pressures.

Maximum pump delivery is maintained to approximately 3.4 bar (50 psi) below either pressure control setting before being reduced.

Control type and pressure range are designated in the model code.

**Load Sensing & Pressure Limiting Compensators**

This compensator provides load sensing control under all pressure conditions up to the desired maximum. It automatically adjusts pump flow in response to a remote pressure signal and maintains outlet pressure at a level slightly above load pressure. The integral pressure limiter overrides the load sensing control, reducing pump displacement as the preset maximum operating pressure is reached.

Standard load-sense differential pressure settings, by control type, follow. See model code for setting range.

**“C**V11B” Standard load-sensing and pressure limiting control with 11 bar differential pressure (standard factory setting). Includes bleed-down orifice to exhaust load-sense signal for low-pressure standby condition.

**“C**V11P” Same as “C**V11B” above, but with bleed-down orifice plugged.

**“C**VC24B” Same as “C**V11B”, but with factory differential pressure setting of 24 bar.

**“C**VC24P” Same as “C**V11P”, but with factory differential pressure setting of 24 bar.
Electric Dual Range Pressure Compensator Control “CD”

Adjustment
1. With the directional valve de-energized, loosen locknut “5” and turn the adjusting screw “4” to the desired first stage pressure setting, then tighten locknut “5”.

2. With solenoid de-energized, turn adjusting spool “1” counterclockwise (CCW) until nut “3” is bottomed in adjusting screw slot. (Second stage setting is now equal to first stage pressure setting.) Turn adjusting spool clockwise (CW) to desired second stage pressure requirements. One complete turn of adjusting spool equals approximately 41 bar (600 psi). Energize solenoid and check pressure setting. De-energize solenoid and re-adjust if necessary. Secure this setting by tightening locknut “2”.

Solenoid Data* (110V AC 50 Hz and 115/120V AC 60 Hz)

<table>
<thead>
<tr>
<th>Solenoid current</th>
<th>Inrush amps (R.M.S.)</th>
<th>Holding amps</th>
</tr>
</thead>
<tbody>
<tr>
<td>115/120V AC 60Hz – 110V AC 50Hz</td>
<td>2.0</td>
<td>.54</td>
</tr>
</tbody>
</table>

* Maximum peak inrush amps approximately 1.4 x R.M.S. value shown.

Refer to catalog GB-C-2015B for additional solenoid valve data.

*Note: Any sliding spool valve, if held shifted under pressure for long periods of time, may stick and not spring return due to fluid residue formation and, therefore, should be cycled periodically to prevent this from happening.
Electric Dual Range
Pressure Compensator with
Maximum Displacement
Stop “CD*D”

Maximum Flow Adjustment
With the system pressure below both
compensator settings, loosen maximum
stop adjusting screw locknut and adjust
screw to desired flow position (turning
screw clockwise decreases flow and
turning screw counterclockwise
increases flow). To lock screw in
position tighten locknut. To assist initial
priming, adjust control setting to at least
40% of maximum flow position.

Compensator Control
1. With the directional valve
de-energized, loosen locknut “5” and
turn the adjusting screw “4” to the
desired first stage pressure setting,
then tighten locknut “5”.

2. With directional valve de-energized,
turn adjusting spool “1”
counterclockwise until nut “3” is
bottomed in adjusting screw slot.
(Second stage setting is now equal
to first stage pressure setting.) Turn
adjusting spool clockwise to desired
second stage pressure
requirements. One complete turn of
adjusting spool equals
approximately 41 bar (600 psi).
Energize solenoid and check
pressure setting. De-energize
solenoid and re-adjust if necessary.
Secure this setting by tightening
locknut “2”.

</tr>
</tbody>
</table>

* Maximum peak inrush amps approximately 1.4 x R.M.S. value shown.

Refer to catalog GB-C-2015B for additional solenoid valve data.
Unloading Valve Control “UV”

With the unloading valve control the variable pump will unload at a preset pressure. The pump will maintain this no flow, low pressure (approximately 14 bar [200 psi]) standby condition, until system pressure drops to about 85% of the preset unloading pressure. The pump will then return on stroke and provide full flow until the preset unloading pressure is reached again.

With this control, an efficient accumulator charging circuit is obtained. The pump will provide full flow to fill the accumulator until the maximum charging pressure is reached. The pump then goes to a standby condition until the accumulator pressure drops to 85% of the desired maximum. The accumulator is then recharged as the cycle starts over again.

A separate right angle check valve must be provided to maintain the accumulator hydraulic charge and prevent back flow when the pump is unloaded. The check valve’s internal leakage must not exceed five drops per minute. The control port must be connected to system pressure, downstream of the check valve.

**Adjustment range**

PVQ10 100–210 bar (1500–3000 psi)
PVQ13 100–140 bar (1500–2000 psi)

Cut-in pressure is 85% of unloading pressure, minimum.

**Setting Pressures**

1. Back out accumulator unloading pressure adjustment screw to below desired unloading pressure.

2. Adjust desired standby pressure.

3. Set accumulator pressure by screwing in the accumulator unloading adjustment screw. Accumulator recharge (cut-in) pressure is a function of the maximum accumulator pressure and is not adjustable.

4. Check pressure settings and re-adjust if necessary.

1. **Series PVQ**
   - P – Inline piston pump
   - V – Variable volume
   - Q – Quiet series

2. **Displacement in cc/rev and pressure ratings**
   - 16 – 16.0 cc/rev (0.976 cir), 210 bar (3000 psi)

3. **Mounting flange specifications**
   - A2 – Flange SAE J744 82-2 (SAE A)

4. **Rotation viewed from shaft end**
   - R – Right hand (cw), standard
   - L – Left hand (ccw), optional

5. **Ports, type and location**
   - SE – Inch SAE O-ring boss rear port

6. **Shafts, input**
   - 1 – Shaft SAE J744 16-1 (SAE A)
     - Straight keyed

7. **Seals**
   - S – Buna N, standard

8. **Pump design number**
   - 11 – Design number subject to change. Installation dimensions remain unchanged for designs 10–19.

9. **Control option**
   - Blank – Without adjustable maximum displacement stop (standard)
   - D – Adjustable maximum displacement stop (optional)

10. **Control type**
    - C** – Pressure compensator. Standard model is C21, indicating setting of 210 bar (3000 psi); range is 02–21 in tens of bar (350–3000 psi).
    - CG – Pressure compensator modified for hydraulic remote control.
    - CV6 – Load sensing. Standard load sensing setting is 6 bar (90 psi) differential. No pressure compensation and no bleed-down orifice. Relief valve is required, such as Vickers CS-06.
Pressure Compensator Control “C”
The pressure compensator control automatically adjusts pump delivery to maintain volume requirements of the system at a preselected operating pressure.

Maximum pump delivery is maintained to approximately 5 bar (70 psi) below the control pressure before being reduced.

The pressure compensator control operates on one side of center and has an adjustment range as designated in the model coding.

**Pressure Compensator Control with Adjustable Maximum Displacement Stop “D”**
The adjustable maximum displacement stop allows the maximum pump delivery to be externally adjusted from 50% to 100%, while maintaining the standard features of the pressure compensated pump.

Remote Control Pressure Compensator “CG”
This compensator is the same as the “C” compensator, except the machine operator is able to change the compensator setting through the use of a remote pilot relief valve. The pump must not be operated with the remote compensator port plugged; port must be connected to a remote pilot relief valve, such as Vickers C-175. The effective compensator setting is the sum of the compensator control setting and the remote relief valve setting.

Load Sensing Compensator Control “CV6”
This control provides load sensing control under all pressure conditions up to the system relief valve setting. It automatically adjusts pump flow in response to a remote pressure signal and maintains outlet pressure at approximately 6 bar (90 psi) above load pressure. By venting the load-sense line with external valving (e.g., Vickers DG4V-3 directional valve), when no flow or pressure demands are placed on the system, the pump will go to a no-flow, low pressure, energy conserving standby mode.

This control does not include maximum pressure limitation, so a separate system relief valve (e.g., Vickers CS-03) is required. The system relief valve will limit the maximum system pressure to the selected level.

---

Unloading Valve Control “UV”

With the unloading valve control the variable pump will unload at a preset pressure. The pump will maintain this no flow, low pressure (approximately 14 bar [200 psi]) standby condition, until system pressure drops to about 85% of the preset unloading pressure. The pump will then return on stroke and provide full flow until the preset unloading pressure is reached again.

With this control, an efficient accumulator charging circuit is obtained. The pump will provide full flow to fill the accumulator until the maximum charging pressure is reached. The pump then goes to a standby condition until the accumulator pressure drops to 85% of the desired maximum. The accumulator is then recharged as the cycle starts over again.

A separate right angle check valve must be provided to maintain the accumulator hydraulic charge and prevent back flow when the pump is unloaded. The check valve’s internal leakage must not exceed five drops per minute. The control port must be connected to system pressure, downstream of the check valve.

**Adjustment range**

- PVQ20 100–210 bar (1500–3000 psi)
- PVQ32 100–140 bar (1500–2000 psi)

Cut-in pressure is 85% of unloading pressure, minimum.

**Setting Pressures**

1. Back out accumulator unloading pressure adjustment screw to below desired unloading pressure.
2. Adjust desired standby pressure.
3. Set accumulator pressure by screwing in the accumulator unloading adjustment screw. Accumulator recharge (cut-in) pressure is a function of the maximum accumulator pressure and is not adjustable.
4. Check pressure settings and re-adjust if necessary.

C** – Pressure compensator. Standard setting 21 in tens of bar (max. setting 201 bar). Range 02–21 in tens of bar.
CM** – Pressure compensator. Standard setting, 10 in tens of bar (max. setting 103 bar). Range 02–10 in tens of bar (350–1500 psi).
C**V**B – Pressure compensator C**, as above with load sensing. Standard load sensing setting is 11 bar (160 psi); range 10–17 bar (150–250 psi); with bleed-down orifice. Example: C21V11B indicates PVQ25 compensator with 210 bar pressure setting and 11 bar load-sense differential.
C**V**P – Pressure compensator with load sensing as C**V**B above, but with bleed-down orifice plugged.
C**VC**B – Pressure compensator with load sensing. Compensator same as C** above. Standard load sensing setting is 24 bar (350 psi), range 17–31 bar (250–450 psi). With bleed-down orifice.
C**VC**P – Pressure compensator with load sensing. Same as C**VC**B above, but with bleed-down orifice plugged.
CG – Pressure compensator modified for hydraulic remote control.
CD** – Electric dual range compensator. PVQ25: CD21 is standard 210 bar setting of high range (24–210 bar). Unit requires low range to be set by customer (20–100 bar).
UV – Unloading Valve for accumulator circuits. See installation details.

10 Control option
Blank – Without adjustable maximum displacement stop (standard)
D – Adjustable maximum displacement stop (optional)

11 Control design
10 – C** and CM**
11 – C**D and CM**D
12 – C**V(C)**B and C**V(C)**P
20 – CD**, CG, and UV

12 Special suffixes
S2 – Shaft up mounting
S9 – Special CG compensator for use with electronically modulated relief valves
**Pressure Compensator Controls**

**“C” & “CM”**

The pressure compensator control automatically adjusts pump delivery to maintain volume requirements of the system at a preselected operating pressure. Maximum pump delivery is maintained to approximately 75 psi (PVQ25) below the pressure setting before being reduced. The pressure compensator control operates on one side of center and has an adjustment range as designated in the model coding.

**“CG”**

requirements of the system at either of the preselected operating pressures.

Maximum pump delivery is maintained to approximately 75 psi (PVQ25) below either pressure control setting before being reduced.

Control type and pressure range are designated in the model code.

**Pressure Compensator Control with Adjustable Maximum Displacement Stop “D”**

The adjustable maximum stop pressure control enables the maximum pump delivery to be externally adjusted from 25% to 100% while maintaining all of the standard features of a pressure compensated pump. To assist initial priming, manual adjustment control setting must be at least 40% of maximum flow position.

**Remote Control Pressure Compensator “CG”**

Exactly the same as the “C” (pressure compensation option), except the machine operator is able to change the compensator setting through the use of a remote pilot relief valve, such as Vickers C-175.

**Electric Dual Range Pressure Compensator Control “CD”**

The dual range pressure compensator control automatically adjusts pump delivery to maintain volume requirements of the system at either of the preselected operating pressures. Maximum pump delivery is maintained to approximately 75 psi (PVQ25) below either pressure control setting before being reduced.

Control type and pressure range are designated in the model code.

**Note:** Graphic symbols shown with external valve(s) and cylinder to illustrate typical usage.

**Load Sensing & Pressure Limiter Compensator Control**
Electric Dual Range Pressure Compensator Control “CD”

Adjustment

1. With the directional valve de-energized, loosen locknut “5” and turn the adjusting screw “4” to the desired first stage pressure setting, then tighten locknut “5”.

2. With solenoid de-energized, turn adjusting spool “1” counterclockwise (CCW) until nut “3” is bottomed in adjusting screw slot. (Second stage setting is now equal to first stage pressure setting.) Turn adjusting spool clockwise (CW) to desired second stage pressure requirements. One complete turn of adjusting spool equals approximately 41 bar (600 psi). Energize solenoid and check pressure setting. De-energize solenoid and re-adjust if necessary. Secure this setting by tightening locknut “2”.

* Maximum peak inrush amps approximately 1.4 x R.M.S. value shown.

Refer to catalog GB-C-2015B for additional solenoid valve data.

*Note: Any sliding spool valve, if held shifted under pressure for long periods of time, may stick and not spring return due to fluid residue formation and,
Electric Dual Range Pressure Compensator with Maximum Displacement Stop “CD**D”

Maximum Flow Adjustment
With the system pressure below both compensator settings, loosen maximum stop adjusting screw locknut and adjust screw to desired flow position (turning screw clockwise decreases flow and turning screw counterclockwise increases flow). To lock screw in position, tighten locknut. To assist initial priming, adjust control setting to at least 40% of maximum flow position.

Compensator Control
1. With the directional valve de-energized, loosen locknut “5” and turn the adjusting screw “4” to the desired first stage pressure setting, then tighten locknut “5”.

2. With directional valve de-energized, turn adjusting spool “1” counterclockwise until nut “3” is bottomed in adjusting screw slot. (Second stage setting is now equal to first stage pressure setting.) Turn adjusting spool clockwise to desired second stage pressure requirements. One complete turn of adjusting spool equals approximately 41 bar (600 psi). Energize solenoid and check pressure setting. De-energize solenoid and re-adjust if necessary. Secure this setting by tightening locknut “2”.

Note: Integral relief valve limits case pressure peaks to 0.7 bar (10 psi) higher than inlet pressure to protect pump. Flow from valve is returned directly to pump inlet. Use of case drain line required to limit steady-state case pressure.
Pressure Compensator Controls
“C” & “CM”
This control automatically varies pump displacement to meet the system flow demand for a constant system pressure. Displacement starts to reduce to zero within 14 bar (200 psi) of the compensator setting. Power draw-off is minimized, therefore, system relief valves should not be required.

Pressure Compensator Control with Adjustable Maximum Displacement Stop “D”
The adjustable maximum stop pressure control enables the maximum pump delivery to be externally adjusted from 25% to 100% while maintaining all of the standard features of a pressure compensated pump. To assist initial priming, manual adjustment control setting must be at least 40% of maximum flow position.

Remote Control Pressure Compensator “CG”
Exactly the same as the “C” (pressure compensation option) except the machine operator is able to change the compensator setting through the use of a remote pilot relief valve.

Electric Dual Range Pressure Compensator Control “CD”
The dual range pressure compensator control automatically adjusts pump delivery to maintain volume requirements of the system at either of

“CG”
Maximum pump delivery is maintained to approximately 3.4 bar (50 psi) below either pressure control setting before being reduced.

Control type and pressure range are designated in the model code.

“CD”
Note: Graphic symbols shown with external valve(s) and cylinder to illustrate typical usage.

Load Sensing & Pressure Limiter Compensator Control
This compensator provides load sensing control under all pressure conditions up to
